TOOLS AND TECHNOLOGIES USED

Automated Teacher Workflow with n8n
DEPI Graduation Project — AI in Education

1. Project Overview

The project automates parts of lesson preparation. A teacher submits lesson information, the workflow validates and processes the input, AI generates educational content, and the final lesson plan is assembled into an editable document for teacher review.

2. Tools and Their Roles

Tool / Technology	Role in the Project
n8n Cloud	Main workflow automation platform. Connects the steps, passes data between nodes, applies conditions, merges generated content, and coordinates the integrations.
Google Forms	Collects teacher input such as subject, grade level, topic, learning objective, lesson duration, and differentiation preference.
Google Sheets	Stores form responses and supports the workflow trigger and data logging.
Google Gemini Chat Model	Generates lesson content such as the lesson outline, student activities, assessment questions, answer key, and differentiated material when requested.
Google Docs	Creates the editable lesson-plan document containing the combined generated content.
Gmail	Supports clarification messages when required input is missing and delivery of the generated document link to the teacher.
GitHub / Project Repository	Intended repository for workflow exports, prompts, diagrams, documentation, and revision history. Report only the version-control actions that have actually been completed.
JSON-style workflow data	Represents the structured data passed between n8n nodes and the exported n8n workflow file.

3. Workflow Summary

1. Teacher submits lesson details through Google Forms.
2. Google Sheets stores the response and starts the n8n workflow.
3. n8n prepares and validates the input.
4. Google Gemini generates the requested educational content.
5. n8n combines and formats the outputs.
6. Google Docs creates the editable lesson plan, and Gmail supports clarification or delivery.

4. Security and Accuracy Notes

Credentials and API keys should be stored securely in n8n credentials or workspace configuration, not embedded in exported workflow files or shared documentation. The teacher should review AI-generated content before classroom use. This document lists technologies described in the supplied project materials; it does not claim that optional or proposed repository practices have already been completed.

Prepared from the project materials supplied for Automated Teacher Workflow with n8n (Tasks 1–4 and workflow links).
